Financial support

The efforts to achieve the financial support of the Journal in 2011 from the Ministry of Science and Higher Education in Poland have begun.

Abstracting services

This Journal is sent to individual receivers from ca. 50 countries of the world and is delivered to the National Libraries and Universities and also to other scientific institutions in ca. 50 countries of the world. The electronic system of Reading Direct allows to access to the electronic version of that journal on-line, in the promotional period free of charge. This Journal is included in the reference list of the Polish Ministry of Science and Higher Education (9 points). The Journal is cited by Abstracting Services such as:

The procedure of its registration in the databases of Compendex, CiteSeer, GetCited and Web of science has begun.

Journal Registration

The Journal is registered by the 1st Civil Department of the District Court in Gliwice, Poland at number 278.

I am pleased to hand over to PT Readers the next issue of Archives of Materials Science and Engineering with the hope that the reading of papers contained in it will be interesting and invite PT authors to publish their works in next issues. I do recommend a scientific paper presented below.

The paper entitled "Microstructure and mechanical properties of C355.0 cast aluminium alloy" by G. Mrówka-Nowotnik and J. Sieniawski on a page 85 informs about the solidification process through analysis of the DSC curves that were obtained at solidification rate of 5K/min. During C355.0 alloy solidification an amount of different intermetallic phases may be formed. Their volume fraction, chemical composition and morphology exert significant influence on a technological and mechanical properties of the aluminum alloys. Therefore the examination and identification of intermetallic phases in examined alloy is a very important part of complex investigation. In this research the effect of precipitation hardening process on the microstructure and mechanical properties of C355.0 alloy was also investigated. The results show that the as-cast microstructure of C355.0 alloy after slow solidification at a cooling rate 5K/min, consisted a wide range of intermetallics phases. The microstructure of investigated C355.0 alloy included: β -Al₃FeSi, α -Al₂(FeMn)₃Si, Al₂Cu, Q-Al₅Cu₂Mg₈Si₆, Si and Mg₂Si phases. Significant changes in as-cast microstructure and mechanical properties followed after artificial aging due to a precipitation strengthening process were observed. To study the solidification process differential scanning calorimetry (DSC) was used. Hardness measurements were utilized to examined the effect of a precipitation hardening (T6) on the mechanical properties. The plastic and mechanical properties were evaluated by uniaxial tensile test at room temperature. To identify intermetallics in C355.0 alloy optical light microscopy (LM), X-ray diffraction (XRD), scanning (SEM) and transmission (TEM) electron microscope were used. The aim of this work was to analyze the solidification process and how T6 heat treatment influenced the microstructure and mechanical properties of C355.0 alloy. Additionally, this paper proposes the best experimental techniques for analysis of the intermetallic phases occurring in the cast and T6 condition. The paper provided essential data about influence of solidification process and aging parameters on the microstructure and mechanical properties of C355.0 alloys.
